

Sleeplessness

Occasional lack of sleep can affect your overall well-being. But if you frequently wake up in the morning, after a night of fitful or disturbed sleep, with widespread muscle pain that lasts through the day, you could have a condition called Fibromyalgia.

We are conducting a research study of an investigational medication for the sleep difficulties associated with Fibromyalgia. You may qualify for this study if:

- You are between 18 years of age or older
- Maintain a normal daytime/awake, nighttime/asleep schedule, including 6½ to 8 hours in bed at night
- Have been diagnosed with Fibromyalgia, or regularly experience the symptoms associated with the condition, including muscle pain, stiffness, headache and fatigue
- Have experienced difficulty sleeping for at least three days out of the week

Qualified participants will receive study medication and all study-related tests at no cost and may be compensated for time and travel.
